

# Quantum Mechanics

## Part III. Quantum Bootstrap\*

---

### Harmonic Oscillator

#### ■ Position and Momentum

#### ■ Discrete v.s. Continuous

**Continuous observables** are observables (Hermitian operators) whose *eigenvalues* can take *continuous real* values.

- Examples: **position**  $x$  of a quantum particle.

$$\hat{x} |x\rangle = x |x\rangle. \quad (1)$$

where

- $\hat{x}$  denotes the position operator (a Hermitian operator corresponding to the position observable of the particle)
- $x \in \mathbb{R}$  is the position eigenvalue.
- $|x\rangle$  the corresponding position eigenstate (the quantum state that describe the particle at the position  $x$ ).
- The Hilbert space dimension is *infinite*. It is always helpful to think about the continuous eigen spectrum as the limit of an *infinitely dense* discrete spectrum.

Many notions of states and operators generalize to the continuous limit. The key is to replace every **summation** by **integration**.

	discrete	→	continuous
orthonormal basis	$\langle i j\rangle = \delta_{ij}$	→	$\langle x x'\rangle = \delta(x - x')$
resolution of identity	$\sum_i  i\rangle \langle i  = \mathbf{1}$	→	$\int d x  x\rangle \langle x  = \mathbf{1}$
state decomposition	$ v\rangle = \sum_i v_i  i\rangle$ $v_i = \langle i v\rangle$	→	$ \psi\rangle = \int d x \psi(x)  x\rangle$ $\psi(x) = \langle x \psi\rangle$
state normalization	$\sum_i  v_i ^2 = 1$	→	$\int d x  \psi(x) ^2 = 1$
scalar product	$\langle u v\rangle = \sum_i \langle u i\rangle \langle i v\rangle$ $= \sum_i u_i^* v_i$	→	$\langle \phi \psi\rangle = \int d x \langle \phi x\rangle \langle x \psi\rangle$ $= \int d x \phi(x)^* \psi(x)$

- **Dirac delta function** - the continuous limit of the Kronecker delta symbol. It is defined by the following property under integration

$$\forall f: \int dx \delta(x) f(x) = f(0). \quad (2)$$

## ■ Position Operator

All position eigenstates  $|x\rangle$  form a set of *orthonormal basis*, called the **position basis**. The **position operator** can be represented as

$$\hat{x} = \int dx |x\rangle x \langle x|. \quad (3)$$

- The position operator is *diagonal* in its own eigen basis.

Effect of the **position operator** on the **wave function**:

- Suppose the particle is in a state  $|\psi\rangle$

$$|\psi\rangle = \int dx \psi(x) |x\rangle, \quad (4)$$

described by the wave function  $\psi(x)$ .

- Applying the position operator,

$$\hat{x} |\psi\rangle = \int dx (x \psi(x)) |x\rangle. \quad (5)$$

So the position operator point-wise multiplies the wave function  $\psi(x)$  with the position eigenvalue  $x$ , i.e.  $\hat{x}: \psi(x) \rightarrow x \psi(x)$ . For this reason, the position operator is often denoted as

$$\hat{x} \simeq x. \quad (6)$$

## ■ Translation

**Translation operator** is an operator that translate the particle from one position to another.

$$\hat{T}(a) |x\rangle = |x+a\rangle. \quad (7)$$

- Suppose the particle was in the  $|x\rangle$  state (at position  $x$ ).
- After applying the translation operator, the particle is in a new state  $|x+a\rangle$  (at position  $x+a$ ).
- Therefore  $\hat{T}(a)$  translates the particle by displacement  $a$ .

In terms of the position basis, the translation operator can be represented as

$$\hat{T}(a) = \int dx |x+a\rangle \langle x|. \quad (8)$$

- Translation operator implements a basis transformation (from  $|x\rangle$  to  $|x+a\rangle$ ). Every basis transformation is unitary. So the translation operator is **unitary**.

**Exc  
1**

Use the definition Eq. (8) to show that  
 $\hat{T}(a)^\dagger \hat{T}(a) = \hat{T}(a) \hat{T}(a)^\dagger = \mathbf{1}$ ,  
 thus the translation operator is unitary.

By definition,

$$\hat{T}(a)^\dagger = \int dx |x\rangle \langle x+a|. \quad (9)$$

We can show that

$$\begin{aligned} \hat{T}(a)^\dagger \hat{T}(a) &= \int dx' |x'\rangle \langle x'+a| \int dx |x+a\rangle \langle x| \\ &= \int dx' \int dx |x'\rangle \langle x'+a|x+a\rangle \langle x| \\ &= \int dx' \int dx |x'\rangle \delta(x' + a - x - a) \langle x| \\ &= \int dx' \int dx |x'\rangle \delta(x' - x) \langle x| \\ &= \int dx |x\rangle \langle x| \\ &= \mathbf{1}. \end{aligned} \quad (10)$$

Similarly,  $\hat{T}(a) \hat{T}(a)^\dagger = \mathbf{1}$ . So  $\hat{T}(a)$  is unitary.

## ■ Momentum Operator

The **momentum operator**  $\hat{p}$  is defined to be the *Hermitian generator* of the unitary operator that translates the position.

$$\hat{T}(a) = \exp\left(-\frac{i \hat{p} a}{\hbar}\right). \quad (11)$$

Conversely,

$$\begin{aligned} \hat{p} &= i \hbar \partial_a \hat{T}(a) |_{a=0} \\ &= i \hbar \lim_{a \rightarrow 0} \frac{\hat{T}(a) - \hat{T}(0)}{a}, \end{aligned} \quad (12)$$

where zero-translation (do-nothing) operator  $\hat{T}(0) \equiv \mathbf{1}$  is always equivalent to the identity operator.

Effect of the **momentum operator** on the **wave function**:

- Suppose the particle is in a state  $|\psi\rangle$

$$|\psi\rangle = \int dx \psi(x) |x\rangle, \quad (13)$$

described by the wave function  $\psi(x)$ .

- Under translation,

$$\begin{aligned} \hat{T}(a) |\psi\rangle &= \int dx \psi(x) |x+a\rangle \\ &= \int dx \psi(x-a) |x\rangle. \end{aligned} \quad (14)$$

- Applying the momentum operator,

$$\begin{aligned} \hat{p} |\psi\rangle &= i \hbar \lim_{a \rightarrow 0} \frac{\hat{T}(a) |\psi\rangle - \hat{T}(0) |\psi\rangle}{a} \\ &= i \hbar \int dx \left( \lim_{a \rightarrow 0} \frac{\psi(x-a) - \psi(x)}{a} \right) |x\rangle \\ &= \int dx (-i \hbar \partial_x \psi(x)) |x\rangle. \end{aligned} \quad (15)$$

The momentum operator maps a wave function  $\psi(x)$  to its derivative  $\partial_x \psi(x)$  (with additional prefactor  $-i \hbar$ ), i.e.  $\hat{p} : \psi(x) \rightarrow -i \hbar \partial_x \psi(x)$ . Therefore, the momentum operator is often written as

$$\hat{p} \simeq -i \hbar \partial_x, \quad (16)$$

when acting on a wave function  $\psi(x)$ . More precisely, its representation in the position basis is given by

$$\hat{p} = -i \hbar \int dx dx' |x\rangle \partial_x \delta(x-x') \langle x'|. \quad (17)$$

**Exc**  
**2**

Show that Eq. (17) is consistent with Eq. (16) when acting on a state  $|\psi\rangle$ .

## ■ Commutation Relation

The **position** and **momentum** operators satisfy the commutation relation

$$[\hat{x}, \hat{p}] = i \hbar. \quad (19)$$

The simplest way to show this is to check the action of these operators on a wave function  $\psi(x)$ . Recall that

$$\hat{x} \simeq x, \quad \hat{p} \simeq -i \hbar \partial_x, \quad (20)$$

the commutator acts as

$$\begin{aligned}
[\hat{x}, \hat{p}] |\psi\rangle &\simeq [x, -i \hbar \partial_x] \psi(x) \\
&= -i \hbar (x \partial_x - \partial_x x) \psi(x) \\
&= i \hbar \psi(x) \\
&\simeq i \hbar |\psi\rangle.
\end{aligned} \tag{21}$$

This verifies the commutation relation.

## ■ Operator Algebra

### ■ Hamiltonian

**Hamiltonian**  $\hat{H}$  for the 1D harmonic oscillator

$$\hat{H} = \frac{1}{2m} \hat{p}^2 + \frac{1}{2} m \omega^2 \hat{x}^2. \tag{22}$$

where the **position**  $\hat{x}$  and **momentum**  $\hat{p}$  operators are defined by their commutation relation

$$[\hat{x}, \hat{p}] = i \hbar. \tag{23}$$

$m$  - mass of the oscillator,  $\omega$  - oscillation frequency.

Let us **rescale the operators**  $\hat{p}$  and  $\hat{x}$

$$\hat{p} \rightarrow \hat{p} \sqrt{\hbar m \omega}, \quad \hat{x} \rightarrow \hat{x} \sqrt{\frac{\hbar}{m \omega}}, \tag{24}$$

then the Hamiltonian looks simpler

$$\hat{H} = \frac{1}{2} \hbar \omega (\hat{p}^2 + \hat{x}^2). \tag{25}$$

- **Energy scale** set by  $\hbar \omega$ .
- New operators  $\hat{x}$  and  $\hat{p}$  are *dimensionless*.
- Commutation relation for the rescaled operators

$$[\hat{x}, \hat{p}] = i \mathbb{1}. \tag{26}$$

### ■ Annihilation and Creation Operators

Define the **annihilation**  $\hat{a}$  and **creation**  $\hat{a}^\dagger$  operators (the names will become evident shortly),

$$\hat{a} = \frac{1}{\sqrt{2}} (\hat{x} + i \hat{p}), \quad \hat{a}^\dagger = \frac{1}{\sqrt{2}} (\hat{x} - i \hat{p}). \tag{27}$$

- $\hat{a}$  and  $\hat{a}^\dagger$  are *Hermitian conjugate* to each other.
- Analogy: complex numbers  $z = x + i y$ ,  $z^* = x - i y \Rightarrow$  position  $\hat{x} \sim$  real part of  $\hat{a}$ , momentum  $\hat{p} \sim$  imaginary part of  $\hat{a}$ .

Commutation relation

$$[\hat{a}, \hat{a}^\dagger] = \mathbb{1}, \quad (28)$$

meaning that

$$\hat{a} \hat{a}^\dagger = \hat{a}^\dagger \hat{a} + \mathbb{1}. \quad (29)$$

Keep applying Eq. (29), it can be proven that (for  $l, m = 0, 1, 2, \dots$ )

$$\hat{a}^l (\hat{a}^\dagger)^m = \sum_{k=0}^{\min(m,l)} \frac{m! l!}{(m-k)! (l-k)! k!} (\hat{a}^\dagger)^{m-k} \hat{a}^{l-k} \quad (30)$$

**Exc 3** | Prove Eq. (30).

## ■ Number Operator

Define the **number operator** as

$$\hat{n} = \hat{a}^\dagger \hat{a}. \quad (37)$$

In terms of the position and momentum operators

$$\hat{n} = \frac{1}{2} (\hat{p}^2 + \hat{x}^2) - \frac{1}{2}. \quad (38)$$

**Exc 4** | Verify Eq. (38) using Eq. (27).

Compare with Eq. (25), the number operator and the Hamiltonian are related by

$$\hat{H} = \hbar \omega \left( \hat{n} + \frac{1}{2} \right). \quad (40)$$

The goal is to find the eigenvalues and eigenstates of the Hamiltonian  $\hat{H}$ . However, given the relation Eq. (40), we can find the eigenvalues  $n$  and eigenstates  $|n\rangle$  of the number operator  $\hat{n}$  instead

$$\hat{n} |n\rangle = n |n\rangle, \quad (41)$$

then  $|n\rangle$  are also eigenstates of  $\hat{H}$  with shifted and rescaled eigenvalues

$$\hat{H} |n\rangle = \hbar \omega \left( n + \frac{1}{2} \right) |n\rangle, \quad (42)$$

which means the energy eigenvalues are

$$E_n = \hbar \omega \left( n + \frac{1}{2} \right). \quad (43)$$

## ■ Quantum Bootstrap

### ■ General Principles

**Quantum bootstrap** is an approach to solve the eigen problem of a given Hermitian operator.

Consider a Hermitian operator  $\hat{n}$  (say the number operator)

$$\hat{n} |n\rangle = n |n\rangle. \quad (44)$$

For any operator  $\hat{O}$ , the following consistency conditions must hold:

- **Eigen condition**

$$\forall n : \langle n | [\hat{n}, \hat{O}] | n \rangle = 0. \quad (45)$$

This can be seen from

$$\langle n | \hat{n} \hat{O} | n \rangle = \langle n | \hat{O} \hat{n} | n \rangle = n \langle n | \hat{O} | n \rangle. \quad (46)$$

- **Positivity constraint**

$$\forall n : \langle n | \hat{O}^\dagger \hat{O} | n \rangle \geq 0, \quad (47)$$

as the squared norm of the state vector  $\hat{O} |n\rangle$  must always be non-negative.

### ■ Level Quantization

Consider a generic operator (for  $m, l = 0, 1, 2, \dots$ )

$$\hat{O}_{m,l} := (\hat{a}^\dagger)^m \hat{a}^l. \quad (48)$$

- This covers the several operators as special cases,

$$\begin{aligned} \hat{O}_{0,0} &= \mathbf{1}, \\ \hat{O}_{0,1} &= \hat{a}, \\ \hat{O}_{1,0} &= \hat{a}^\dagger, \\ \hat{O}_{1,1} &= \hat{a}^\dagger \hat{a} = \hat{n}. \end{aligned} \quad (49)$$

- The indices  $m, l$  interchange under Hermitian conjugate

$$\hat{O}_{m,l}^\dagger = \hat{O}_{l,m}. \quad (50)$$

- **Operator product expansion:** product of two operators can be expanded into linear combination of operators.

$$\hat{O}_{k,l} \hat{O}_{m,n} = \sum_{p=0}^{\min(m,l)} \frac{m! l!}{(m-p)! (l-p)! p!} \hat{O}_{k+m-p, l+n-p}. \quad (51)$$

**Exc 5** | Prove Eq. (51) using Eq. (30).

In particular, if one of the operator is  $\hat{O}_{1,1} = \hat{n}$ , Eq. (51) reduces to

$$\begin{aligned} \hat{n} \hat{O}_{m,l} &= \hat{O}_{m+1,l+1} + m \hat{O}_{m,l}, \\ \hat{O}_{m,l} \hat{n} &= \hat{O}_{m+1,l+1} + l \hat{O}_{m,l}. \end{aligned} \quad (53)$$

Therefore, we have the following commutator

$$[\hat{n}, \hat{O}_{m,l}] = \hat{n} \hat{O}_{m,l} - \hat{O}_{m,l} \hat{n} = (m-l) \hat{O}_{m,l}, \quad (54)$$

then the **eigen condition** Eq. (45) becomes

$$\langle n | [\hat{n}, \hat{O}_{m,l}] | n \rangle = (m-l) \langle n | \hat{O}_{m,l} | n \rangle = 0. \quad (55)$$

- If  $m \neq l$  (i.e.  $m-l \neq 0$ ), for Eq. (55) to hold, we must have

$$\langle n | \hat{O}_{m,l} | n \rangle = 0 \quad (\text{for } m \neq l). \quad (56)$$

- If  $m = l$ , Eq. (55) is automatically satisfied. In this case, the expectation value  $\langle n | \hat{O}_{m,m} | n \rangle$  can take any real number, which we denote as  $W_{m|n}$ ,

$$W_{m|n} := \langle n | \hat{O}_{m,m} | n \rangle \in \mathbb{R}. \quad (57)$$

To determine  $W_{m|n}$ , we notice that

$$\begin{aligned} \langle n | \hat{O}_{m,m} \hat{n} | n \rangle &= n \langle n | \hat{O}_{m,m} | n \rangle = n W_{m|n}, \\ \langle n | \hat{O}_{m,m} \hat{n} | n \rangle &= \langle n | \hat{O}_{m+1,m+1} | n \rangle + m \langle n | \hat{O}_{m,m} | n \rangle \\ &= W_{m+1|n} + m W_{m|n}. \end{aligned} \quad (58)$$

This leads to a recurrent equation

$$W_{m+1|n} = (n-m) W_{m|n}. \quad (59)$$

Given the initial condition at  $m = 0$  (the normalization of eigenstates)

$$W_{0|n} = \langle n | n \rangle = 1, \quad (60)$$

the solution of Eq. (59) is

$$W_{m|n} = \prod_{l=0}^{m-1} (n-l). \quad (61)$$

Finally, we examine the **positivity constraint** Eq. (47) with  $\hat{O}_{0,m} = \hat{a}^m$ ,

$$\langle n | \hat{O}_{0,m}^\dagger \hat{O}_{0,m} | n \rangle = \langle n | (\hat{a}^\dagger)^m \hat{a}^m | n \rangle = \langle n | \hat{O}_{m,m} | n \rangle = W_{m|n} \geq 0. \quad (62)$$

To ensure  $W_{m|n} \geq 0$ , according to Eq. (61), we must have

$$\forall n, m : \prod_{l=0}^{m-1} (n-l) \geq 0 \quad (63)$$

This corresponds to a series of *inequalities*

$$\begin{aligned} n &\geq 0, \\ n(n-1) &\geq 0, \\ n(n-1)(n-2) &\geq 0, \\ n(n-1)(n-2)(n-3) &\geq 0, \\ &\dots \end{aligned} \quad (64)$$

To satisfy all these inequalities,  $n$  can only be natural numbers

$n = 0, 1, 2, \dots \in \mathbb{N}.$

(65)

- The eigenvalues  $n = 0, 1, 2, \dots$  are *discrete*! For this reason, the operator  $\hat{n}$  is called the **number** operator, which counts the number of *elementary excitations*.
- The  $n = 0$  state, denoted as  $|0\rangle$ , is also called the **vacuum state**, as it describes a state with no excitations. It is also the **ground state** of the Hamiltonian  $\hat{H}$ .
- The eigenstates  $|n\rangle$  has the following expectation value

$$\langle n | \hat{O}_{m,l} | n \rangle = \langle n | (\hat{a}^\dagger)^m \hat{a}^l | n \rangle = \begin{cases} 0 & \text{if } m \neq l, \\ n! / m! & \text{if } m = l. \end{cases} \quad (66)$$

## ■ Number Basis Representation

The commutation relation Eq. (54) implies that on any eigenstate  $|n\rangle$ ,

$$\hat{n} \hat{O}_{m,l} | n \rangle = (n + m - l) \hat{O}_{m,l} | n \rangle, \quad (67)$$

meaning that the state  $\hat{O}_{m,l} | n \rangle$  must be an eigenstate of  $\hat{n}$  with eigenvalue  $n + m - l$ . Therefore, it should be identified with the  $|n+m-l\rangle$  state,

$$\hat{O}_{m,l} | n \rangle \propto |n+m-l\rangle. \quad (68)$$

In particular,

- for  $\hat{O}_{0,1} = \hat{a}$ ,  
 $\hat{a} | n \rangle \propto |n-1\rangle;$
  - for  $\hat{O}_{1,0} = \hat{a}^\dagger$ ,
- (69)

$$\hat{a}^\dagger |n\rangle \propto |n+1\rangle. \quad (70)$$

To determine the proportionality constant, we can compute the squared norms

$$\begin{aligned} \langle n | \hat{a}^\dagger \hat{a} | n \rangle &= \langle n | \hat{n} | n \rangle = n, \\ \langle n | \hat{a} \hat{a}^\dagger | n \rangle &= \langle n | (\hat{a}^\dagger \hat{a} + \mathbb{1}) | n \rangle = \langle n | (\hat{n} + \mathbb{1}) | n \rangle = n + 1. \end{aligned} \quad (71)$$

Assuming the number basis states  $|n\rangle$  are normalized, we must have

$$\begin{aligned} \hat{a} |n\rangle &= \sqrt{n} |n-1\rangle, \\ \hat{a}^\dagger |n\rangle &= \sqrt{n+1} |n+1\rangle. \end{aligned} \quad (72)$$

## ■ Summary

- Annihilation and creation operators

$$\begin{cases} \hat{a} = \frac{1}{\sqrt{2}} (\hat{x} + i \hat{p}) \\ \hat{a}^\dagger = \frac{1}{\sqrt{2}} (\hat{x} - i \hat{p}) \end{cases}, \quad \begin{cases} \hat{x} = \frac{1}{\sqrt{2}} (\hat{a} + \hat{a}^\dagger) \\ \hat{p} = \frac{1}{\sqrt{2}i} (\hat{a} - \hat{a}^\dagger) \end{cases}. \quad (73)$$

They satisfies the commutation relation

$$[\hat{x}, \hat{p}] = i \mathbb{1} \Leftrightarrow [\hat{a}, \hat{a}^\dagger] = \mathbb{1}. \quad (74)$$

- Number operator

$$\hat{n} = \hat{a}^\dagger \hat{a}. \quad (75)$$

It defines a discrete spectrum  $\hat{n} |n\rangle = n |n\rangle$  for  $n \in \mathbb{N}$ . Such that

$$\begin{aligned} \hat{a} |n\rangle &= \sqrt{n} |n-1\rangle, \\ \hat{a}^\dagger |n\rangle &= \sqrt{n+1} |n+1\rangle. \end{aligned} \quad (76)$$

- Hamiltonian

$$\hat{H} = \frac{1}{2} \hbar \omega (\hat{p}^2 + \hat{x}^2) = \hbar \omega \left( \hat{n} + \frac{1}{2} \right). \quad (77)$$

- Eigen energies

$$E_n = \hbar \omega \left( n + \frac{1}{2} \right). \quad (78)$$

- Every eigenstate  $|n\rangle$  can be raised from the ground state by

$$|n\rangle = \frac{1}{\sqrt{n!}} (\hat{a}^\dagger)^n |0\rangle. \quad (79)$$

# Angular Momentum

## ■ Operator Algebra

### ■ Definition

The **angular momentum** of a quantum system (in 3D space) is described by a set of *three Hermitian operators*  $\hat{J}_1, \hat{J}_2, \hat{J}_3$ , jointly written as  $\hat{\mathbf{J}} = (\hat{J}_1, \hat{J}_2, \hat{J}_3)$ , satisfying the following commutation relation

$$[\hat{J}_a, \hat{J}_b] = i \epsilon_{abc} \hat{J}_c. \quad (80)$$

- $\epsilon_{abc}$  is the Levi-Civita symbol: the sign of the  $abc$  permutation.
- Equivalently, in vector form,  $\hat{\mathbf{J}} \times \hat{\mathbf{J}} = i \hat{\mathbf{J}}$ .

Examples:

- **Orbital angular momentum** of a particle.

$$\hat{\mathbf{L}} = \hat{\mathbf{x}} \times \hat{\mathbf{p}}. \quad (81)$$

- $\hat{\mathbf{x}} = (\hat{x}_1, \hat{x}_2, \hat{x}_3)$  and  $\hat{\mathbf{p}} = (\hat{p}_1, \hat{p}_2, \hat{p}_3)$  are position and momentum operators in 3D space.
- In component form,  $\hat{L}_a = \epsilon_{abc} \hat{x}_b \hat{p}_c$ .
- From  $[\hat{x}_a, \hat{p}_b] = i \delta_{ab}$  (set  $\hbar = 1$  for simplicity), one can verify that

$$[\hat{L}_a, \hat{L}_b] = i \epsilon_{abc} \hat{L}_c. \quad (82)$$

- **Spin angular momentum** of a qubit.

$$\hat{\mathbf{S}} = \frac{1}{2} \hat{\boldsymbol{\sigma}}. \quad (83)$$

- $\hat{\boldsymbol{\sigma}} = (\hat{\sigma}^x, \hat{\sigma}^y, \hat{\sigma}^z)$  are the Pauli matrices.
- The commutation relation of Pauli matrices implies

$$[\hat{S}_a, \hat{S}_b] = i \epsilon_{abc} \hat{S}_c. \quad (84)$$

We will discuss the *general property* of angular momentum operators without specifying whether it is orbital or spin.

## ■ Casimir Operator

A **Casimir operator** is a operator that commutes with all components of  $\hat{\mathbf{J}}$ . It turns out

that there is only one such operator: the **squared angular momentum**  $\hat{\mathbf{J}}^2 = \hat{\mathbf{J}} \cdot \hat{\mathbf{J}}$ ,

$$\hat{\mathbf{J}}^2 = \hat{J}_1^2 + \hat{J}_2^2 + \hat{J}_3^2. \quad (85)$$

- $\hat{\mathbf{J}}^2$  is Hermitian.
- By Eq. (80), one can verify that (for  $a = 1, 2, 3$ )

$$[\hat{\mathbf{J}}^2, \hat{J}_a] = 0. \quad (86)$$

**Exc 6** | Prove Eq. (86).

## ■ Raising and Lowering Operators

Define the **raising**  $\hat{J}_+$  and **lowering**  $\hat{J}_-$  operators

$$\hat{J}_\pm = \hat{J}_1 \pm i \hat{J}_2. \quad (87)$$

- In analogy to  $e^{\pm i\theta} = \cos \theta \pm i \sin \theta$ .
- $\hat{J}_\pm$  are *not* Hermitian. Under Hermitian conjugate:  $\hat{J}_\pm^\dagger = \hat{J}_\mp$ .

By definition Eq. (87), one can prove the following relations (for  $l = 0, 1, 2, \dots$ )

$$\hat{J}_3 \hat{J}_\pm^l = \hat{J}_\pm^l (\hat{J}_3 \pm l). \quad (88)$$

$$\hat{J}_\mp^{l+1} \hat{J}_\pm^{l+1} = \hat{J}_\mp^l \hat{J}_\pm^l \left( \hat{\mathbf{J}}^2 - (\hat{J}_3 \pm l)(\hat{J}_3 \pm (l+1)) \right). \quad (89)$$

**Exc 7** | Prove Eq. (88).

**Exc 8** | Prove Eq. (89).

## ■ Quantum Bootstrap

### ■ Problem Setup

$\hat{\mathbf{J}}^2$  and  $\hat{J}_3$  commute  $\Rightarrow$  they share the same set of eigenstates, which can be labeled by two independent quantum numbers, called  $j$  and  $m \Rightarrow$  as a common eigenstate,  $|j, m\rangle$  must satisfy the eigen equation for both operators

$$\begin{aligned} \hat{\mathbf{J}}^2 |j, m\rangle &= \lambda_j |j, m\rangle, \\ \hat{J}_3 |j, m\rangle &= \lambda_m |j, m\rangle, \end{aligned} \quad (90)$$

- $\lambda_j$  is the the eigenvalue of  $\hat{\mathbf{J}}^2$  of the  $|j, m\rangle$  state,
- $\lambda_m$  is the the eigenvalue of  $\hat{J}_3$  of the  $|j, m\rangle$  state.

The possible values of  $\lambda_j, \lambda_m$  can be determined by the **quantum bootstrap** method.

## ■ General Principles

Any operator  $\hat{O}$  must satisfy the following consistency conditions.

### • Eigen condition

$$\begin{aligned}
 \langle j, m | f(\hat{\mathbf{J}}^2, \hat{J}_3) \hat{O} | j, m \rangle \\
 &= \langle j, m | \hat{O} f(\hat{\mathbf{J}}^2, \hat{J}_3) | j, m \rangle \\
 &= f(\lambda_j, \lambda_m) \langle j, m | \hat{O} | j, m \rangle,
 \end{aligned} \tag{91}$$

for any function  $f$ . In particular, it implies

$$\langle j, m | [\hat{\mathbf{J}}^2, \hat{O}] | j, m \rangle = \langle j, m | [\hat{J}_3, \hat{O}] | j, m \rangle = 0. \tag{92}$$

### • Positivity constraint

$$\langle j, m | \hat{O}^\dagger \hat{O} | j, m \rangle \geq 0. \tag{93}$$

## ■ Angular Momentum Quantization

The goal is to estimate the expectation value of  $\hat{J}_\mp^l \hat{J}_\pm^{l'}$  on the common eigen state  $|j, m\rangle$  for general  $l$  and  $l'$ , i.e.  $\langle j, m | \hat{J}_\mp^l \hat{J}_\pm^{l'} | j, m \rangle$ , satisfying all the consistency conditions.

Using Eq. (88), it can be shown that

$$[\hat{J}_3, \hat{J}_\mp^l \hat{J}_\pm^{l'}] = \mp(l - l') \hat{J}_\mp^l \hat{J}_\pm^{l'}, \tag{94}$$

**Exc  
9**

Prove Eq. (94) using Eq. (88).

which implies

$$\langle j, m | [\hat{J}_3, \hat{J}_\mp^l \hat{J}_\pm^{l'}] | j, m \rangle = \mp(l - l') \langle j, m | \hat{J}_\mp^l \hat{J}_\pm^{l'} | j, m \rangle. \tag{96}$$

On the other hand, apply Eq. (92) with  $\hat{O} = \hat{J}_\mp^l \hat{J}_\pm^{l'}$ ,

$$(l - l') \langle j, m | \hat{J}_\mp^l \hat{J}_\pm^{l'} | j, m \rangle = 0. \tag{97}$$

- If  $l \neq l'$ , we must have  $\langle j, m | \hat{J}_\mp^l \hat{J}_\pm^{l'} | j, m \rangle = 0$ .

- If  $l = l'$ , Eq. (97) is automatically satisfied, and there is no restriction on  $\langle j, m | \hat{J}_\mp^l \hat{J}_\pm^{l'} | j, m \rangle$ . Its value remains to be determined, and can be defined as

$$A_{j,m}^{\pm,l} := \langle j, m | \hat{J}_\mp^l \hat{J}_\pm^l | j, m \rangle. \quad (98)$$

To determine  $A_{j,m}^{\pm,l}$ , start with Eq. (89) and use the eigen condition Eq. (91)  $\Rightarrow$  recurrent equation:

$$A_{j,m}^{\pm,l+1} = (\lambda_j - (\lambda_m \pm l) (\lambda_m \pm (l+1))) A_{j,m}^{\pm,l}. \quad (99)$$

**Exc  
10**

Derive Eq. (99) using Eq. (89).

Given that  $A_{j,m}^{\pm,0} = \langle j, m | j, m \rangle = 1$ , the solution of Eq. (99) is

$$A_{j,m}^{\pm,l} = \prod_{k=0}^{l-1} (\lambda_j - (\lambda_m \pm k) (\lambda_m \pm (k+1))). \quad (100)$$

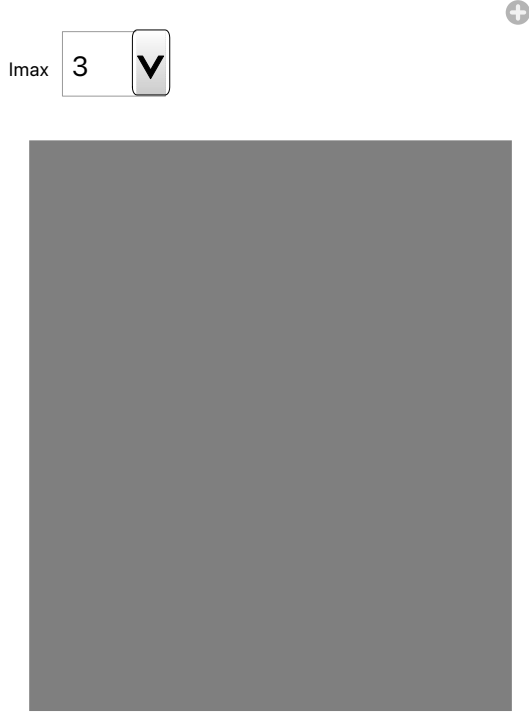

Finally, the positivity constraint Eq. (93) for  $\hat{O} = \hat{J}_\pm^l$  requires

$$A_{j,m}^{\pm,l} = \langle j, m | \hat{J}_\mp^l \hat{J}_\pm^l | j, m \rangle \geq 0, \quad (101)$$

which gives a series of inequalities (for  $l = 1, 2, \dots$ )

$$\prod_{k=0}^{l-1} (\lambda_j - (\lambda_m \pm k) (\lambda_m \pm (k+1))) \geq 0. \quad (102)$$

If the inequalities are solved for  $l = 1, 2, \dots, l_{\max}$  (up to a maximal  $l$ ), the feasible region for  $\lambda_m$  and  $\lambda_j$  looks like:

Solutions are *discrete*!  $\Rightarrow$  **angular momentum quantization**. They are described by

$$\begin{aligned} \lambda_j &= j(j+1) \text{ for } j = 0, \frac{1}{2}, 1, \frac{3}{2}, \dots \\ \lambda_m &= m \quad \text{for } m = -j, -j+1, \dots, j-1, j \end{aligned} \quad (103)$$

- For **orbital** angular momentum  $j$  takes *integer* values.  
For **spin** angular momentum  $j$  can also be *half-integers*.
- The eigen equations in Eq. (90) become

$$\begin{aligned} \hat{\mathbf{J}}^2 |j, m\rangle &= j(j+1) |j, m\rangle, \\ \hat{J}_3 |j, m\rangle &= m |j, m\rangle. \end{aligned} \quad (104)$$

- The expectation value reads

$$\langle j, m | \hat{J}_\mp^l \hat{J}_\pm^{l'} | j, m \rangle = \begin{cases} 0 & \text{if } l \neq l' \\ \prod_{k=0}^{l-1} (j(j+1) - (m \pm k)(m \pm (k+1))) & \text{if } l = l' \end{cases} \quad (105)$$

## ■ Operator Representation

From Eq. (88) with  $l = 1$ ,  $\hat{J}_3 \hat{J}_\pm = \hat{J}_\pm (\hat{J}_3 \pm 1)$  we have

$$\begin{aligned} \hat{J}_3 \hat{J}_\pm |j, m\rangle &= \hat{J}_\pm (\hat{J}_3 \pm 1) |j, m\rangle \\ &= (m \pm 1) \hat{J}_\pm |j, m\rangle \end{aligned} \quad (106)$$

$\Rightarrow$  the state  $\hat{J}_\pm |j, m\rangle$  (as long as it is not zero) is also an eigenstate of  $\hat{J}_3$  but with the eigenvalue  $(m \pm 1) \Rightarrow \hat{J}_\pm |j, m\rangle$  is just the  $|j, m \pm 1\rangle$  state (up to overall coefficient)

$$\hat{J}_\pm |j, m\rangle = c_{j,m}^\pm |j, m \pm 1\rangle. \quad (107)$$

To determine the coefficient  $c_{j,m}^\pm$ , use Eq. (105) with  $l = l' = 1$

$$\langle j, m | \hat{J}_\mp \hat{J}_\pm |j, m\rangle = j(j+1) - m(m \pm 1). \quad (108)$$

On the other hand

$$\langle j, m | \hat{J}_\mp \hat{J}_\pm |j, m\rangle = (c_{j,m}^\pm)^2 \langle j, m \pm 1 | j, m \pm 1\rangle = (c_{j,m}^\pm)^2. \quad (109)$$

Combining Eq. (108) and Eq. (109),  $c_{j,m}^\pm$  can be solved

$$c_{j,m}^\pm = \sqrt{j(j+1) - m(m \pm 1)}. \quad (110)$$

In conclusion, we have obtained the following representations for angular momentum operators (from Eq. (104) and Eq. (107))

$$\begin{aligned} \hat{\mathbf{J}}^2 |j, m\rangle &= j(j+1) |j, m\rangle, \\ \hat{J}_3 |j, m\rangle &= m |j, m\rangle, \\ \hat{J}_\pm |j, m\rangle &= \sqrt{j(j+1) - m(m \pm 1)} |j, m \pm 1\rangle. \end{aligned}$$

(111)

Induction implies that all basis states can be

- either *raised* from the *lowest weight* state,

$$|j, m\rangle = \left( \frac{(j-m)!}{(2j)!(j+m)!} \right)^{1/2} \hat{J}_+^{j+m} |j, -j\rangle, \quad (112)$$

- or *lowered* from the *highest weight* state,

$$|j, m\rangle = \left( \frac{(j+m)!}{(2j)!(j-m)!} \right)^{1/2} \hat{J}_-^{j-m} |j, j\rangle. \quad (113)$$

This is just like the Harmonic oscillator.

To make the analogy more precise, take the large- $j$  limit,

$$\begin{aligned} \frac{\hat{J}_+}{\sqrt{2j}} |j, -j+n\rangle &= \sqrt{n+1} |j, -j+n+1\rangle + \mathcal{O}(j^{-1/2}), \\ \frac{\hat{J}_-}{\sqrt{2j}} |j, -j+n\rangle &= \sqrt{n} |j, -j+n-1\rangle + \mathcal{O}(j^{-1/2}). \end{aligned} \quad (114)$$

Under the following correspondence

$$\begin{aligned}
|j, -j + n\rangle &\rightarrow |n\rangle, \\
(2j)^{-1/2} \hat{J}_- &\rightarrow a, \quad (2j)^{-1/2} \hat{J}_+ \rightarrow a^\dagger,
\end{aligned} \tag{115}$$

the boson creation/annihilation algebra Eq. (72) can be reproduced approximately (to the leading order). In this sense, *spin excitations* can also be treated as bosons, called **magnons**.

## ■ Summary

Angular momentum operator  $\hat{\mathbf{J}} = (\hat{J}_1, \hat{J}_2, \hat{J}_3)$  is defined by the commutation relation

$$\hat{\mathbf{J}} \times \hat{\mathbf{J}} = i \hat{\mathbf{J}}. \tag{116}$$

Based on  $\hat{\mathbf{J}}$ , we can define

- The total angular momentum operator

$$\hat{\mathbf{J}}^2 = \hat{J}_1^2 + \hat{J}_2^2 + \hat{J}_3^2. \tag{117}$$

- The raising and lowering operators

$$\hat{J}_\pm = \hat{J}_1 \pm i \hat{J}_2. \tag{118}$$

They acts on the common eigen basis  $|j, m\rangle$  as

$$\begin{aligned}
\hat{\mathbf{J}}^2 |j, m\rangle &= j(j+1) |j, m\rangle, \\
\hat{J}_3 |j, m\rangle &= m |j, m\rangle, \\
\hat{J}_\pm |j, m\rangle &= \sqrt{j(j+1) - m(m \pm 1)} |j, m \pm 1\rangle,
\end{aligned} \tag{119}$$

where

$$\begin{aligned}
j &= 0, \frac{1}{2}, 1, \frac{3}{2}, \dots, \\
m &= -j, -j+1, \dots, j-1, j.
\end{aligned} \tag{120}$$
